Total Users by Day

Project Summary

Chatcom analytics module tracked **50 registered users** and **1,998 messages** over a 30-day window. Every one of the 50 registered users sent at least one message — a 100% activation rate — indicating strong onboarding and no dormant accounts in this sample. Activity spans three chat spaces (two group chats and one direct-message channel) and shows a clear repeating weekly rhythm.

Key Insights

1. Full user activation — no dead accounts

All 50 users are active (50 Total Users = 50 Active Users). Unlike many messaging platforms where a large share of sign-ups go quiet, every account here is contributing messages. This is a strong health signal for onboarding and initial engagement.

2. Balanced usage across chat spaces — no single room dominates

Messages split almost evenly: group-design (690, 34.5%), group-project (672, 33.6%), and dm-general (636, 31.8%). No feature is underused — users are engaging with both group collaboration and direct messaging in roughly equal measure, which suggests the app's core features (1-to-1 chat and group chat) are both genuinely useful to users, not just present.

3. Clear weekly usage cycle

Daily Active Users oscillates in a repeating wave between roughly 20 and 50 users/day rather than trending up or down. This pattern of regular peaks and dips is consistent with weekly cycles.
